Optimization for Machine Learning CS-439

Lecture 1: Introduction & Convexity

Martin Jaggi

EPFL – github.com/epfml/OptML_course

February 23, 2018

Outline

- \triangleright Convexity, Gradient Methods, Constrained Optimization, Proximal algorithms, Subgradient Methods, **Stochastic** Gradient Descent, Coordinate Descent, Frank-Wolfe, Accelerated Methods, Primal-Dual context and certificates, Lagrange and Fenchel Duality, Second-Order Methods including Quasi-Newton, Derivative-Free Optimization.
- ▶ Advanced Contents:
	- \triangleright Parallel and Distributed Optimization Algorithms, Synchronous and Asynchronous Communication.
	- \triangleright Computational and Statistical Trade-Offs (Time vs Data vs Accuracy). Variance Reduced Methods, and Lower Bounds.
	- ▶ Non-Convex Optimization: Convergence to Critical Points, Saddle-Point methods, Alternating minimization for matrix and tensor factorizations

Course Organization

\blacktriangleright Lectures

- \blacktriangleright Exercises
- \blacktriangleright Mini-Project

Grading: Written final exam, closed book

See details on [course webpage on github](#page-0-0)

Optimization

\triangleright General optimization problem (unconstrained minimization)

minimize $f(\mathbf{x})$ with $\mathbf{x} \in \mathbb{R}^d$

- ► candidate solutions, variables, parameters $x \in \mathbb{R}^d$
- ► objective function $f : \mathbb{R}^d \to \mathbb{R}$
- ighthropolety: technical assumption: f is continuous and differentiable

Why? And How?

Optimization is everywhere

machine learning, big data, statistics, data analysis of all kinds, finance, logistics, planning, control theory, mathematics, search engines, simulations, and many other applications ...

\blacktriangleright Mathematical Modeling:

- \triangleright defining & modeling the optimization problem
- \triangleright Computational Optimization:
	- \triangleright running an (appropriate) optimization algorithm

Optimization for Machine Learning

\blacktriangleright Mathematical Modeling:

- \triangleright defining $\&$ and measuring the machine learning model
- \triangleright Computational Optimization:
	- \blacktriangleright learning the model parameters

But what about deep learning? Convex theory does not apply, so is useless?

Optimization Algorithms

- ▶ Optimization at large scale: simplicity rules!
- \blacktriangleright Main approaches:
	- **Example 1** Gradient Descent
	- ▶ Stochastic Gradient Descent (SGD)
	- **E** Coordinate Descent
- \blacktriangleright History:
	- \triangleright 1847: Cauchy proposes gradient descent
	- ▶ 1950s: Linear Programs, soon followed by non-linear, SGD
	- \blacktriangleright 1980s: General optimization, convergence theory
	- ▶ 2005-today: Large scale optimization, convergence of SGD

Example: Coordinate Descent

Goal: Find $\mathbf{x}^* \in \mathbb{R}^d$ minimizing $f(\mathbf{x})$. (Example: $d = 2$)

Idea: Update one coordinate at a time, while keeping others fixed.

Example: Coordinate Descent

Goal: Find $\mathbf{x}^* \in \mathbb{R}^d$ minimizing $f(\mathbf{x})$.

Idea: Update one coordinate at a time, while keeping others fixed.

Example: Coordinate Descent

Goal: Find $\mathbf{x}^* \in \mathbb{R}^d$ minimizing $f(\mathbf{x})$.

Idea: Update one coordinate at a time, while keeping others fixed.

Chapter 1 Theory of Convex Functions

EPFL Machine Learning and Optimization Laboratory 11/29

Convex Sets

A set C is convex if the line segment between any two points of C lies in C, i.e., if for any $x, y \in C$ and any λ with $0 \leq \lambda \leq 1$, we have $\mathbf{v} + (1 - \mathbf{v})\mathbf{v} \in C$

$$
\lambda \mathbf{x} + (1 - \lambda) \mathbf{y} \in C.
$$

Left Convex. M_{ideal} , Not convey, since line correct not in est. Middle Not convex, since line segment not in set. Right Not convex, since some, but not all boundary points are contained in the set. tegrals, and, in the most general form, since the most and published and published are contained in the set.
EPFL Machine Learning and Optimization Laboratory .
12/29

Properties of Convex Sets

 \blacktriangleright Intersections of convex sets are convex

Observation 1.2. Let C_i , $i \in I$ be convex sets, where I is a (possibly infinite) index set. Then $C = \bigcap_{i \in I} C_i$ is a convex set.

 \blacktriangleright (later) Projections onto convex sets are *unique*, and *often* efficient to compute

$$
P_C(\mathbf{x}') := \operatorname{argmin}_{\mathbf{y} \in C} \|\mathbf{y} - \mathbf{x}'\|
$$

Convex Functions and α is concave if α is convex, and strictly convex, and strictly convex, and strictly convex, and strictly contains α

Definition $Definition$

A function $f: \mathbb{R}^d \to \mathbb{R}$ is convex if (i) $\text{dom}(f)$ is a convex set and (ii) for all $x, y \in \text{dom}(f)$, and λ with $0 \leq \lambda \leq 1$, we have $\lim_{n \to \infty}$ intersects in $\lim_{n \to \infty}$ if $\lim_{n \to \infty}$ is convex if $\lim_{n \to \infty}$ if $\lim_{n \to \infty}$ and for all $\lim_{n \to \infty}$

lies above the graph of f . **Geometrically:** The line segment between $(\mathbf{x}, f(\mathbf{x}))$ and $(\mathbf{y}, f(\mathbf{y}))$

Motivation: Convex Optimization

Convex Optimization Problems are of the form

min $f(\mathbf{x})$ s.t. $\mathbf{x} \in C$

where both

- \blacktriangleright f is a convex function
- \blacktriangleright C is a convex set (note: \mathbb{R}^d is convex)

Properties of Convex Optimization Problems

 \triangleright Every local minimum is a global minimum, see next...

Motivation: Solving Convex Optimization - Provably

For convex optimization problems, all algorithms

- \blacktriangleright Coordinate Descent
- \blacktriangleright Gradient Descent
- \triangleright Stochastic Gradient Descent
- ▶ Projected [Stoch.] Gradient Descent

do **converge** to the global optimum! $\left(\frac{1}{2} \right)$ (assuming f differentiable)

Example Theorem: For convex problems, the **convergence rate** of "most" of the above algorithms is proportional to $\frac{1}{t}$, i.e.

$$
f(\mathbf{x}_t) - f(\mathbf{x}^{\star}) \leq \frac{c}{t}
$$

(where x^* is some optimal solution to the problem.)

Motivation: Convergence Theory

Convex Functions & Sets

Epigraph: The graph of a function $f : \mathbb{R}^d \to \mathbb{R}$ is defined as $\{(\mathbf{x}, f(\mathbf{x})) | \mathbf{x} \in \text{dom}(f)\},\$

The **epigraph** of a function $f : \mathbb{R}^d \to \mathbb{R}$ is defined as

$$
\mathbf{epi}(f) := \{ (\mathbf{x}, \alpha) \in \mathbb{R}^{d+1} \, | \, \mathbf{x} \in \mathbf{dom}(f), \alpha \ge f(\mathbf{x}) \},
$$

Observation 1.4. A function is convex *iff* its epigraph is a convex set.

EPFL Machine Learning and Optimization Laboratory 18/29

Convex Functions & Sets

Proof: recall $epi(f) := \{(\mathbf{x}, \alpha) \in \mathbb{R}^{d+1} | \mathbf{x} \in \text{dom}(f), \alpha \geq f(\mathbf{x})\}$

Convex Functions

Examples of convex functions

- \blacktriangleright Linear functions: $f(\mathbf{x}) = \mathbf{a}^{\top}\mathbf{x}$
- Affine functions: $f(\mathbf{x}) = \mathbf{a}^\top \mathbf{x} + b$
- Exponential: $f(\mathbf{x}) = e^{\alpha \mathbf{x}}$
- \blacktriangleright Norms. Every norm on \mathbb{R}^d is convex.

Convexity of a norm $f(\mathbf{x})$

By the triangle inequality $f(x + y) \le f(x) + f(y)$ and homogeneity of a norm $f(a\mathbf{x}) = |a|f(\mathbf{x})$, a scalar:

$$
f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{y}) \le f(\lambda \mathbf{x}) + f((1 - \lambda)\mathbf{y}) = \lambda f(\mathbf{x}) + (1 - \lambda)f(\mathbf{y}).
$$

We used the triangle inequality for the inequality and homogeneity for the equality.

Jensen's inequality

Lemma (Jensen's inequality)

Let f be convex, $\mathbf{x}_1, \ldots, \mathbf{x}_m \in \textbf{dom}(f)$, $\lambda_1, \ldots, \lambda_m \in \mathbb{R}_+$ such that $\sum_{i=1}^m \lambda_i = 1$. Then

$$
f\left(\sum_{i=1}^m \lambda_i \mathbf{x}_i\right) \leq \sum_{i=1}^m \lambda_i f(\mathbf{x}_i).
$$

For $m = 2$, this is convexity. The proof of the general case is Exercise 1.

First-order characterization of convexity

Lemma ([\[BV04,](#page-28-1) 3.1.3])

Suppose that $dom(f)$ is open and that f is differentiable; in particular, the gradient (vector of partial derivatives)

$$
\nabla f(\mathbf{x}) := \left(\frac{\partial f(\mathbf{x})}{\partial x_1}, \dots, \frac{\partial f(\mathbf{x})}{\partial x_d}\right)
$$

exists at every point $x \in \text{dom}(f)$. Then f is convex if and only if $dom(f)$ is convex and

$$
f(\mathbf{y}) \ge f(\mathbf{x}) + \nabla f(\mathbf{x})^{\top}(\mathbf{y} - \mathbf{x})
$$
 (1)

holds for all $x, y \in \text{dom}(f)$.

First-order characterization of convexity

Second-order characterization of convexity Lemma ([\[BV04,](#page-28-1) 3.1.4])

Suppose that $dom(f)$ is open and that f is twice differentiable; in particular, the **Hessian** (matrix of second partial derivatives)

$$
\nabla^2 f(\mathbf{x}) = \begin{pmatrix}\n\frac{\partial^2 f(\mathbf{x})}{\partial x_1 \partial x_1} & \frac{\partial^2 f(\mathbf{x})}{\partial x_1 \partial x_2} & \cdots & \frac{\partial^2 f(\mathbf{x})}{\partial x_1 \partial x_d} \\
\frac{\partial^2 f(\mathbf{x})}{\partial x_2 \partial x_1} & \frac{\partial^2 f(\mathbf{x})}{\partial x_2 \partial x_2} & \cdots & \frac{\partial^2 f(\mathbf{x})}{\partial x_2 \partial x_d} \\
\vdots & \vdots & \cdots & \vdots \\
\frac{\partial^2 f(\mathbf{x})}{\partial x_d \partial x_1} & \frac{\partial^2 f(\mathbf{x})}{\partial x_d \partial x_2} & \cdots & \frac{\partial^2 f(\mathbf{x})}{\partial x_d \partial x_d}\n\end{pmatrix}
$$

exists at every point $x \in \text{dom}(f)$ and is symmetric. Then f is convex if and only if $dom(f)$ is convex, and for all $x \in dom(f)$. we have

 $\nabla^2 f(\mathbf{x}) \succeq 0$ (i.e. $\nabla^2 f(\mathbf{x})$ is positive semidefinite).

(A symmetric matrix M is positive semidefinite if $\mathbf{x}^\top M \mathbf{x} \geq 0$ for all \mathbf{x} , and positive definite if $\mathbf{x}^\top M \mathbf{x} > 0$ for all \mathbf{x} .)

EPFL Machine Learning and Optimization Laboratory 24/29

Operations that preserve convexity

Lemma (Exercise 4)

- (i) Let f_1, f_2, \ldots, f_m be convex functions, $\lambda_1, \lambda_2, \ldots, \lambda_m \in \mathbb{R}_+$. Then $f := \sum_{i=1}^m \lambda_i f_i$ is convex on $\textbf{dom}(f) := \bigcap_{i=1}^m \textbf{dom}(f_i)$.
- (ii) Let f be a convex function with $\text{dom}(f) \subseteq \mathbb{R}^d$, $g: \mathbb{R}^m \to \mathbb{R}^d$ an affine function, meaning that $g(\mathbf{x}) = A\mathbf{x} + \mathbf{b}$, for some matrix $A \in \mathbb{R}^{d \times m}$ and some vector $\mathbf{b} \in \mathbb{R}^{d}$. Then the function $f \circ q$ (that maps x to $f(Ax + b)$) is convex on $\textbf{dom}(f \circ g) := \{ \mathbf{x} \in \mathbb{R}^m : g(\mathbf{x}) \in \textbf{dom}(f) \}.$

Solving Convex Optimization Problems - Provably Definition

A local minimum of $f : dom(f) \to \mathbb{R}$ is a point x such that there exists $\varepsilon > 0$ with

 $f(\mathbf{x}) \leq f(\mathbf{y})$ $\forall \mathbf{y} \in \text{dom}(f)$ satisfying $\|\mathbf{y} - \mathbf{x}\| < \varepsilon$.

Lemma

Let x^{*} be a local minimum of a convex function $f: \textbf{dom}(f) \to \mathbb{R}$. Then \mathbf{x}^{\star} is a global minimum, meaning that

 $f(\mathbf{x}^*) \le f(\mathbf{y}) \quad \forall \mathbf{y} \in \textbf{dom}(f).$

Proof.

EPFL Machine Learning and Optimization Laboratory 26/29

Solving Convex Optimization Problems - Provably

Lemma

Suppose that f is convex and differentiable over an open domain dom(f). Let $x \in \text{dom}(f)$. If $\nabla f(x) = 0$, then x is a global minimum.

Proof

Suppose that $\nabla f(\mathbf{x}) = \mathbf{0}$. According to our Lemma on the first-order characterization of convexity, we have

Strictly convex functions

Definition ([\[BV04,](#page-28-1) 3.1.1])

A function $f : dom(f) \to \mathbb{R}$ is strictly convex if (i) $dom(f)$ is convex and (ii) for all $x \neq y \in \text{dom}(f)$ and all $\lambda \in (0, 1)$, we have

$$
f(\lambda \mathbf{x} + (1 - \lambda)\mathbf{y}) < \lambda f(\mathbf{x}) + (1 - \lambda)f(\mathbf{y}).\tag{2}
$$

Lemma

Let $f : dom(f) \to \mathbb{R}$ be strictly convex. Then f has at most one global minimum.
