

# KUKA youBot Hardware Interfaces

Jan Paulus  
Bonn-Rhein-Sieg University

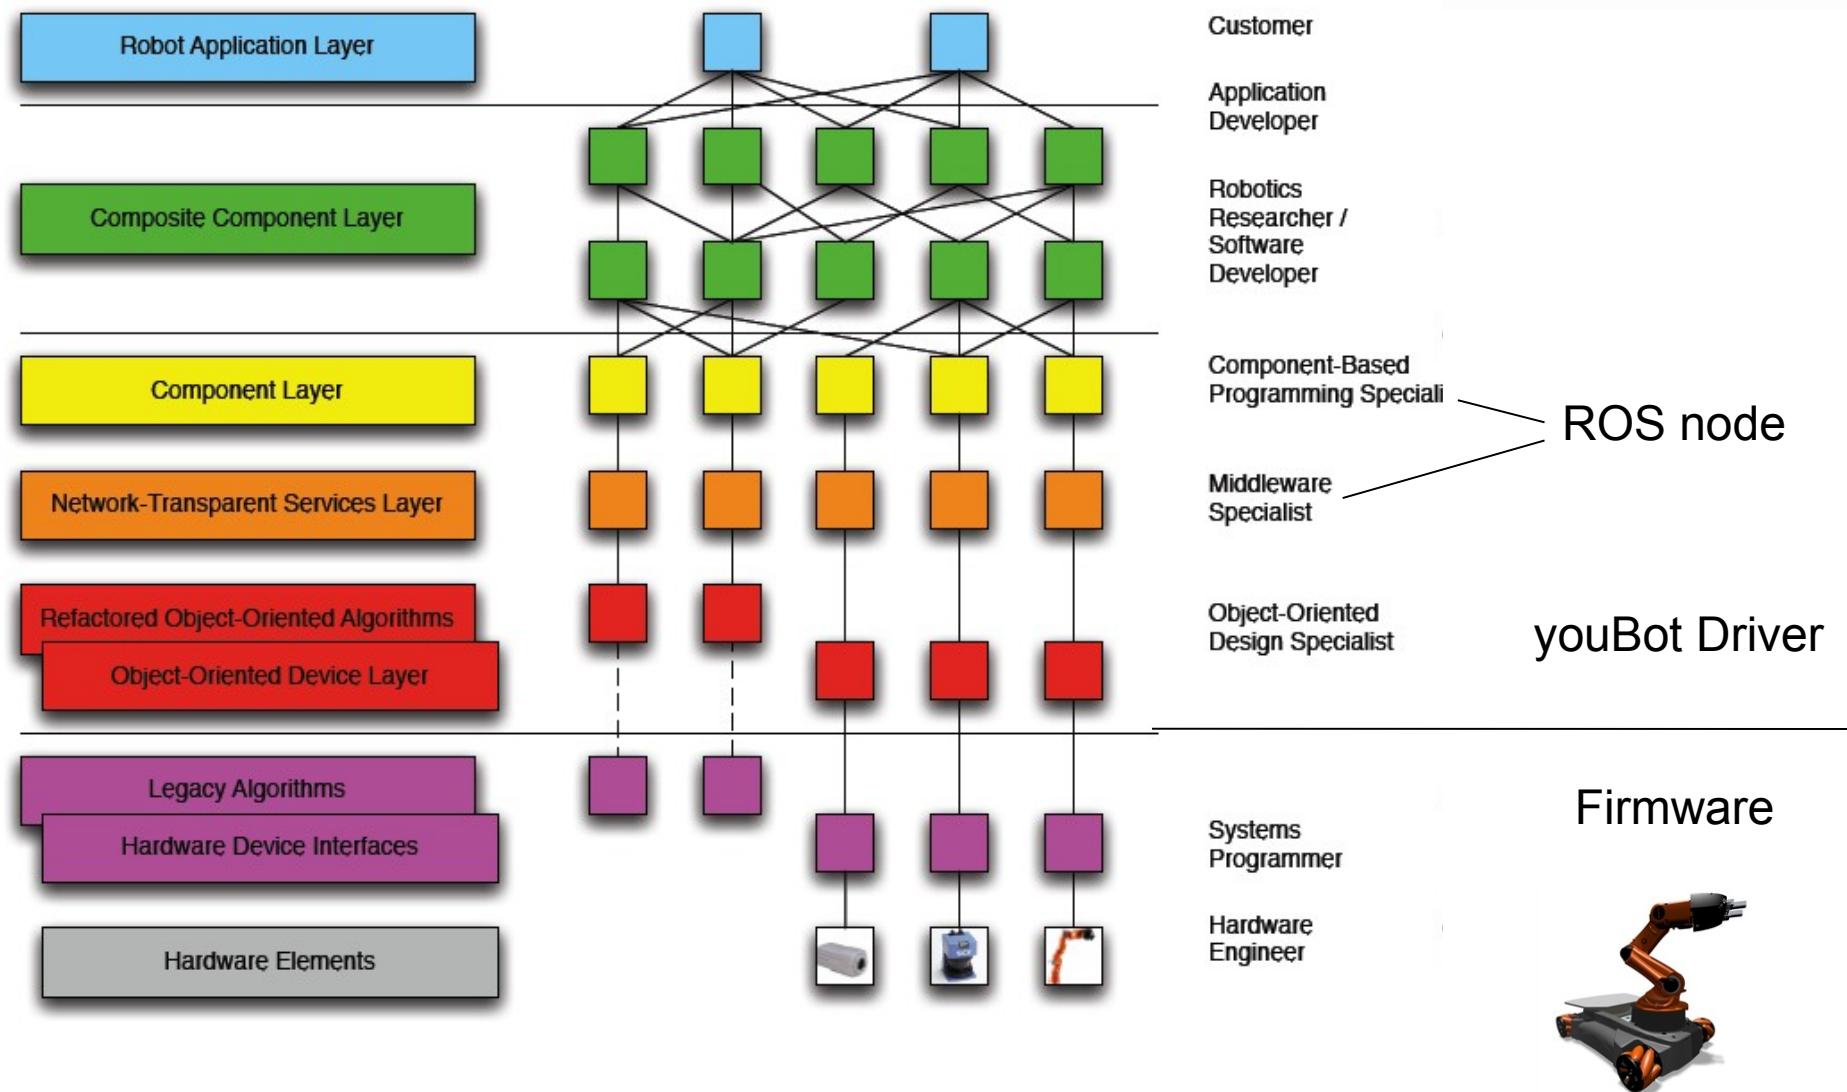

Hochschule  
Bonn-Rhein-Sieg

# youBot hardware

- omni-directional mobile platform
- 5-degree-of-freedom manipulator
- 2-finger gripper
- all joints with relative encoders
- real-time EtherCAT communication
- on-board PC with embedded CPU,  
2 GB RAM, 32 GB SSD Flash, USB

# Abstraction Layers

# YouBot Motor Controllers

Each joint has its own motor controller, which contains:

- ARM Cortex-M3 microcontroller
- Hall Sensors
- EtherCAT Interface
- Position, Velocity, Current PID-Controllers
- I<sub>2</sub>t monitoring

# Firmware Controllers

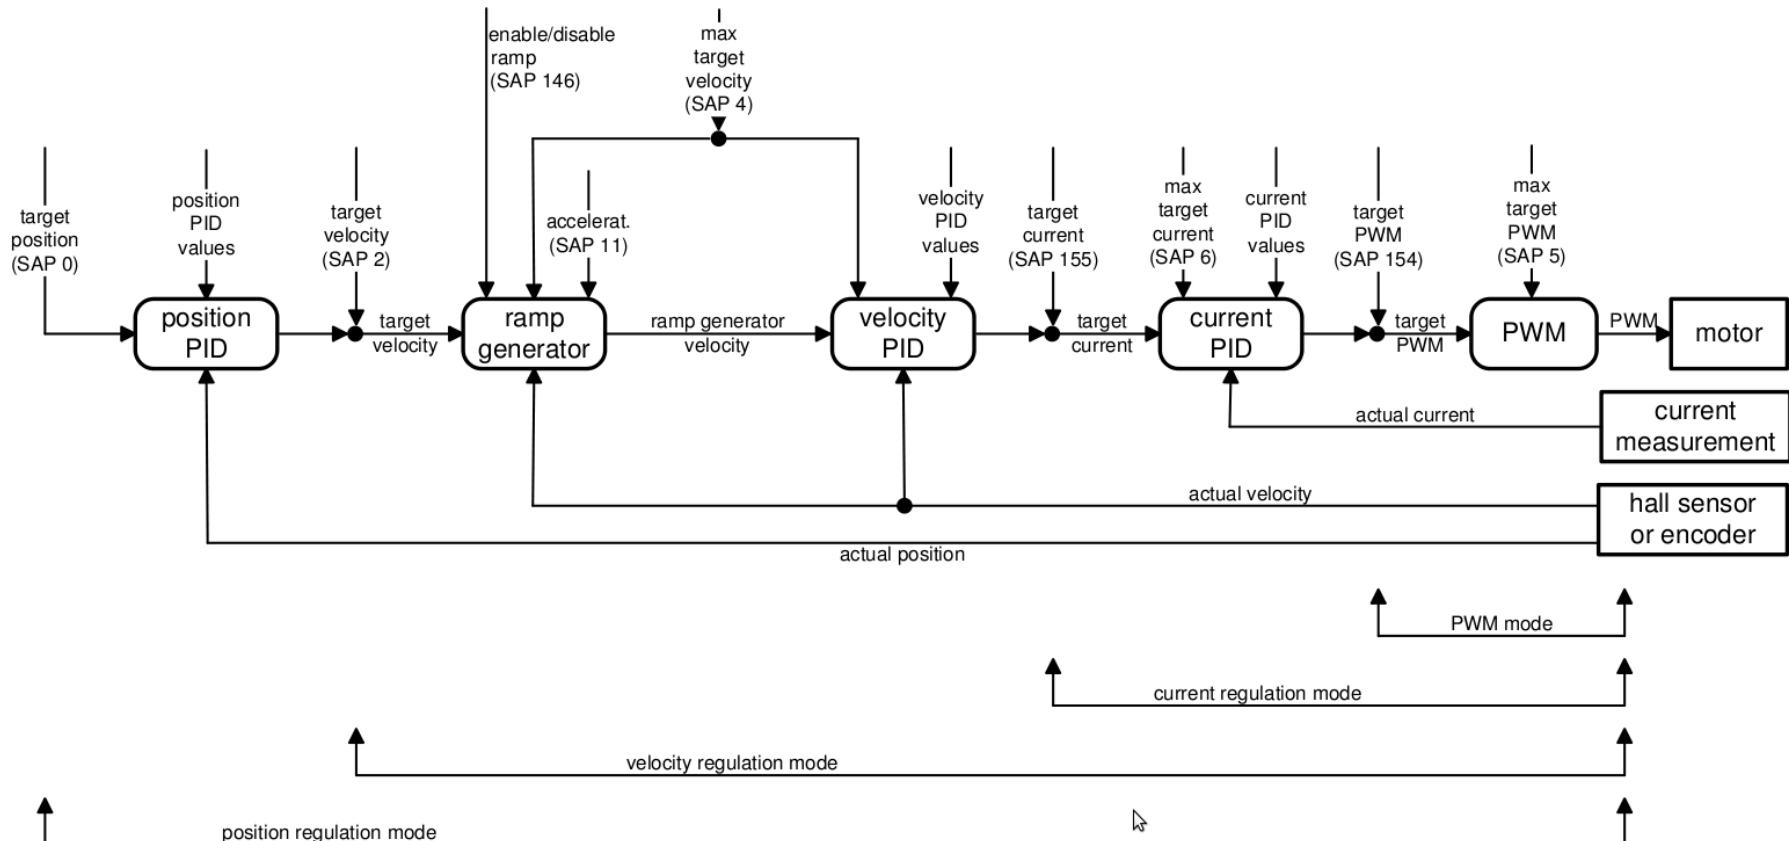

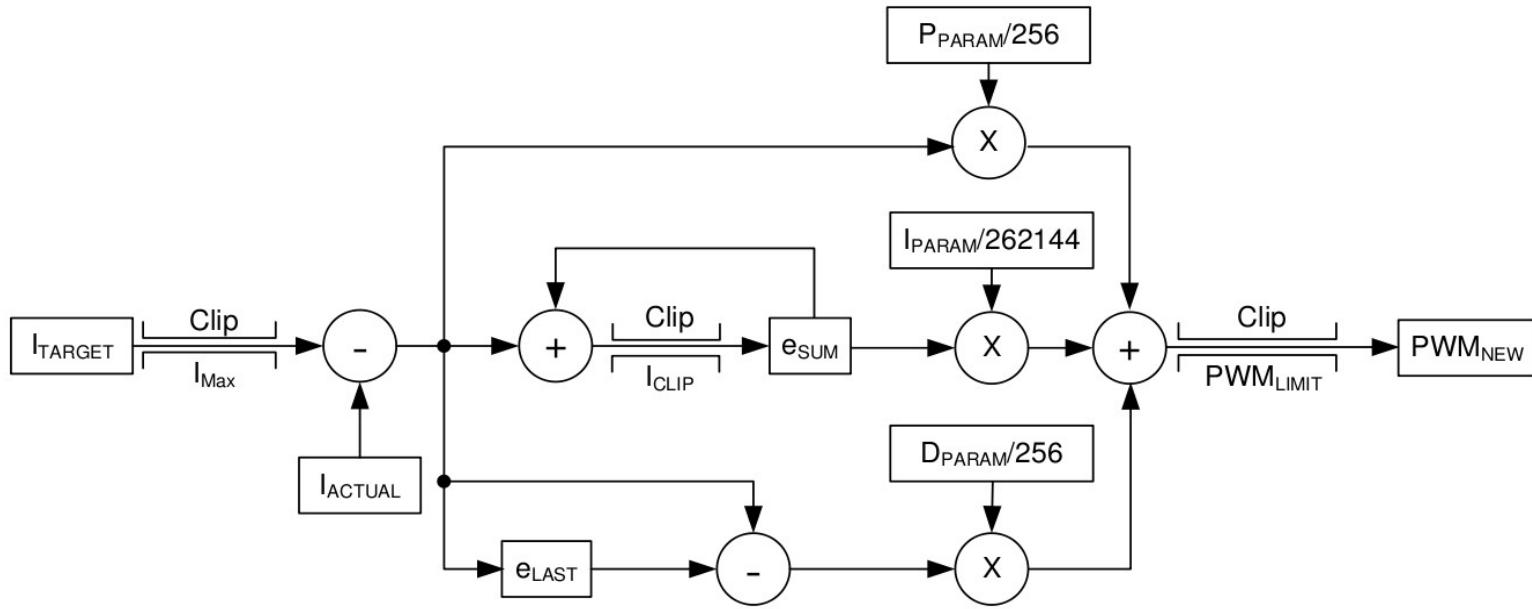

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# Current Controller

$I_{ACTUAL}$  Actual motor current

$I_{TARGET}$  Target motor current

$I_{Max}$  Max. target motor current

$e_{LAST}$  Error value of the last PID calculation

$e_{SUM}$  Error sum for integral calculation

$P_{PARAM}$  Current P parameter

$I_{PARAM}$  Current I parameter

$D_{PARAM}$  Current D parameter

$I_{CLIP}$  Current I-Clipping parameter

[1/10%] of max PWMLIMIT (a value of 1000 allows the I-part to reach the PWMLIMIT)

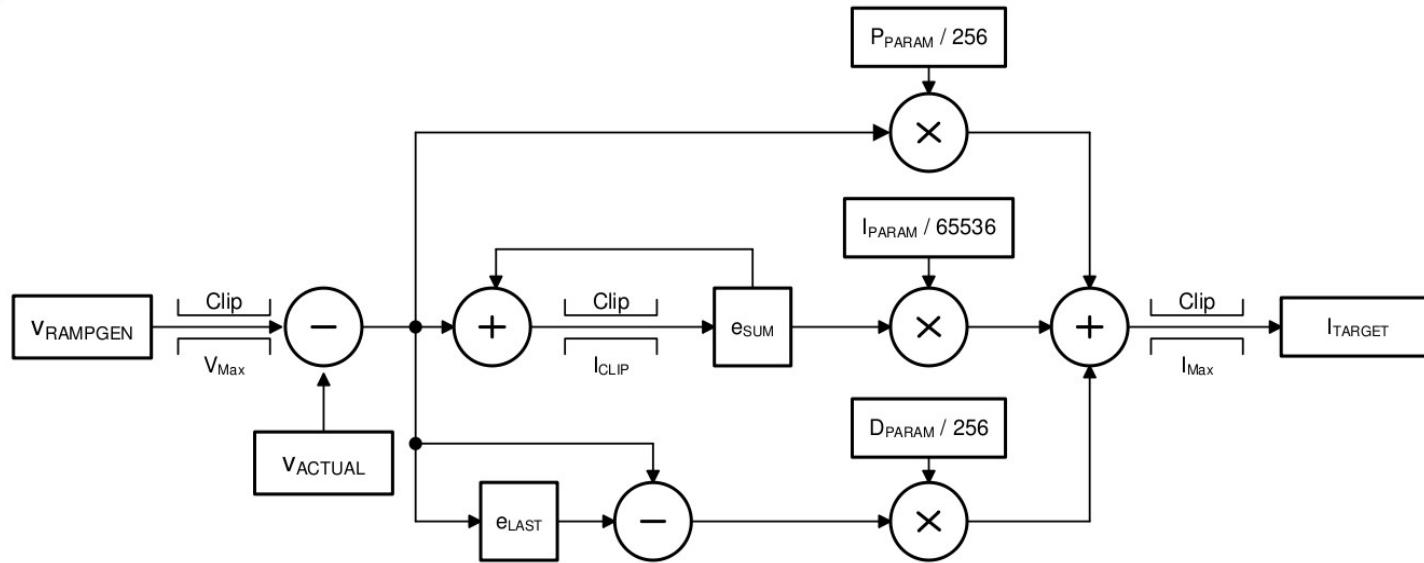

$PWM_{LIMIT}$  PWM Limit

$PWM_{NEW}$  New target PWM value

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# Velocity Controller

$v_{\text{ACTUAL}}$  Actual motor velocity

$v_{\text{RAMPGEN}}$  Target velocity of ramp generator

$v_{\text{Max}}$  Max. target velocity

$e_{\text{LAST}}$  Error value of the last PID calculation

$e_{\text{SUM}}$  Error sum for integral calculation

$P_{\text{PARAM}}$  Velocity P parameter

$I_{\text{PARAM}}$  Velocity I parameter

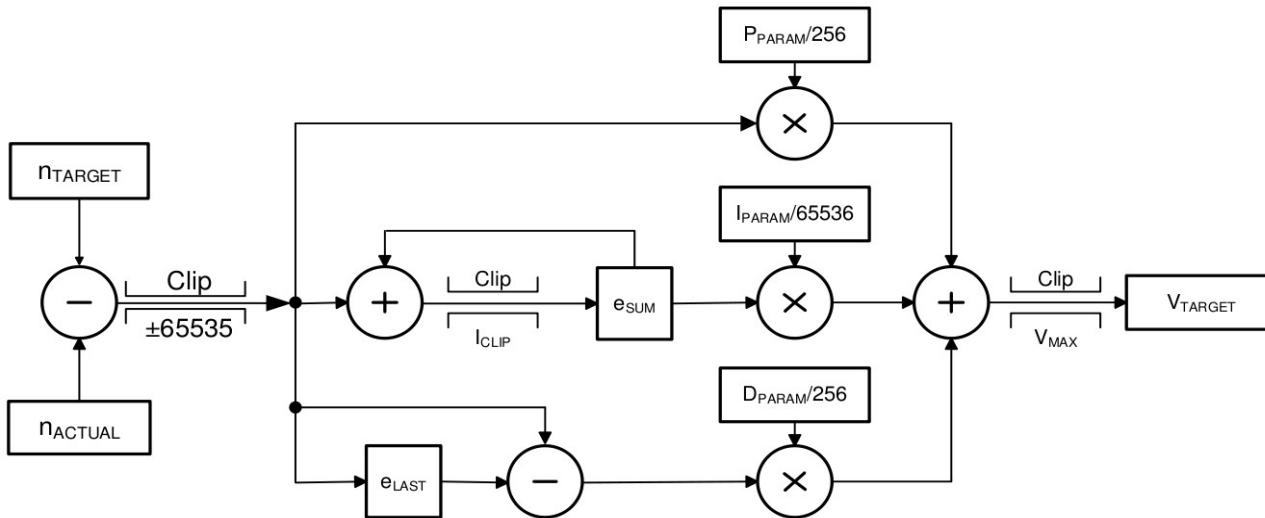

$D_{\text{PARAM}}$  Velocity D parameter

$I_{\text{CLIP}}$  Velocity I-Clipping parameter

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# Position Controller

$n_{\text{ACTUAL}}$  Actual motor position

$n_{\text{TARGET}}$  Target motor position

$e_{\text{LAST}}$  Error value of the last PID calculation

$e_{\text{SUM}}$  Error sum for integral calculation

$P_{\text{PARAM}}$  Position P parameter

$I_{\text{PARAM}}$  Position I parameter

$D_{\text{PARAM}}$  Position D parameter

$I_{\text{CLIP}}$  Position I-Clipping parameter [1/10%] of  $V_{\text{MAX}}$   
(a value of 1000 allows the I-part to reach  $V_{\text{MAX}}$ )

$V_{\text{MAX}}$  Max. allowed velocity

$V_{\text{TARGET}}$  New target velocity for ramp generator

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# Positioning algorithm

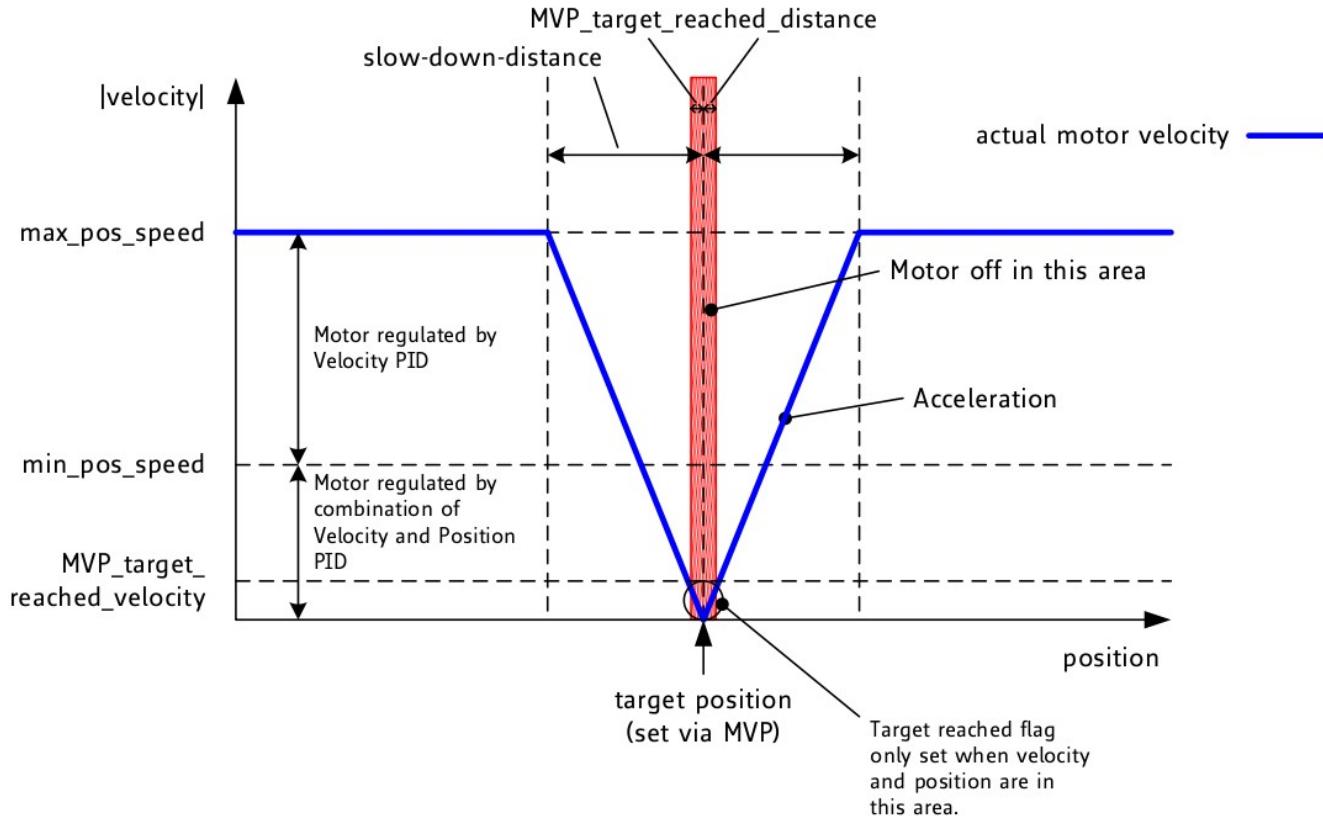

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# PID-Parameters

Every PID regulation provides two parameter sets, which are used as follows:

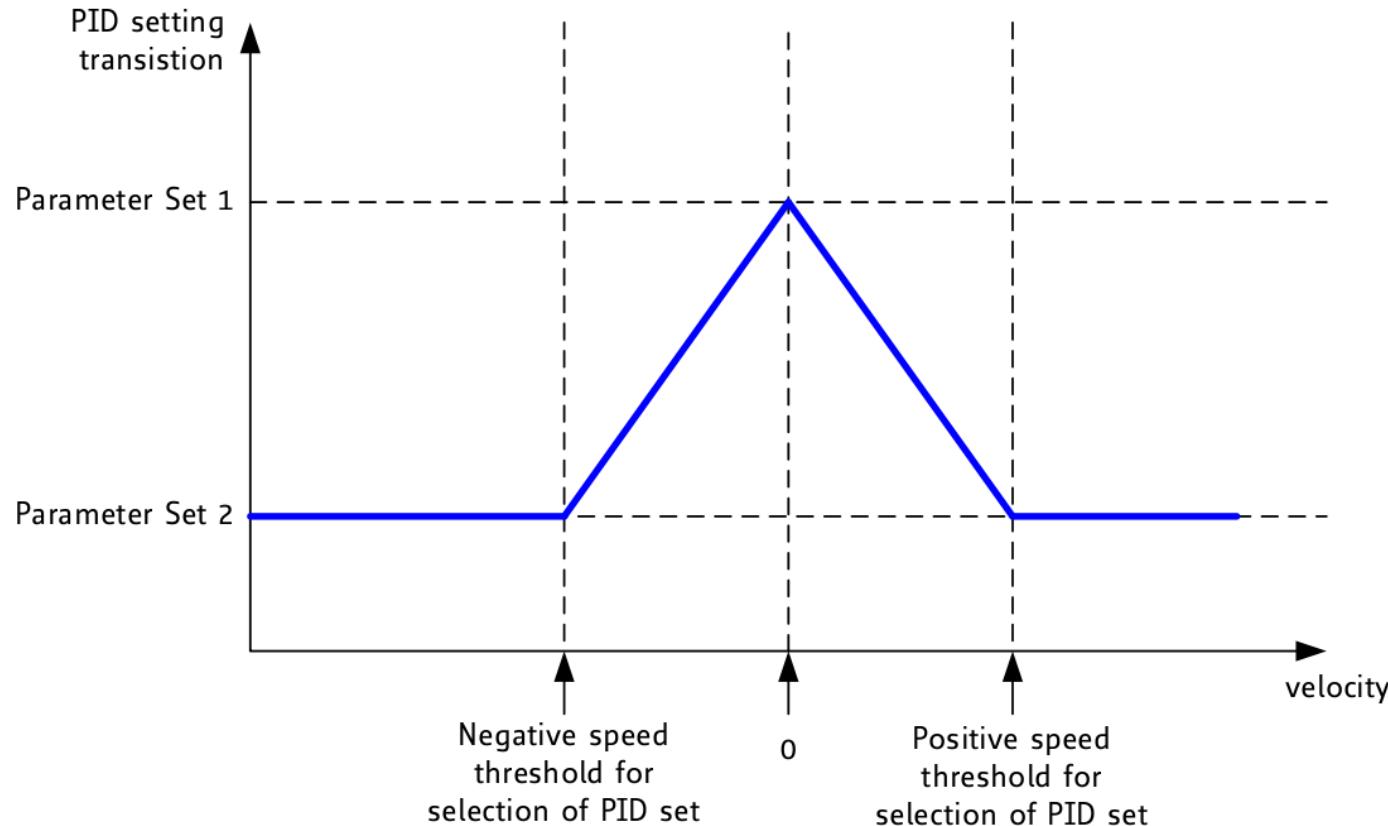

Figure taken from TRINAMIC TMCM-1632/TMCM-KR-841 EtherCAT Manual (V2.3 / 2011-Dec-12)

# Safety Features

## I<sup>2</sup>t monitor:

- The I<sup>2</sup>t monitor determines the sum of the square of the motor current over a given time.
- If the I<sup>2</sup>t limit is reached the motor will stop and a I<sup>2</sup>t exceed flag will be set. The user need to unset the flag to continue.

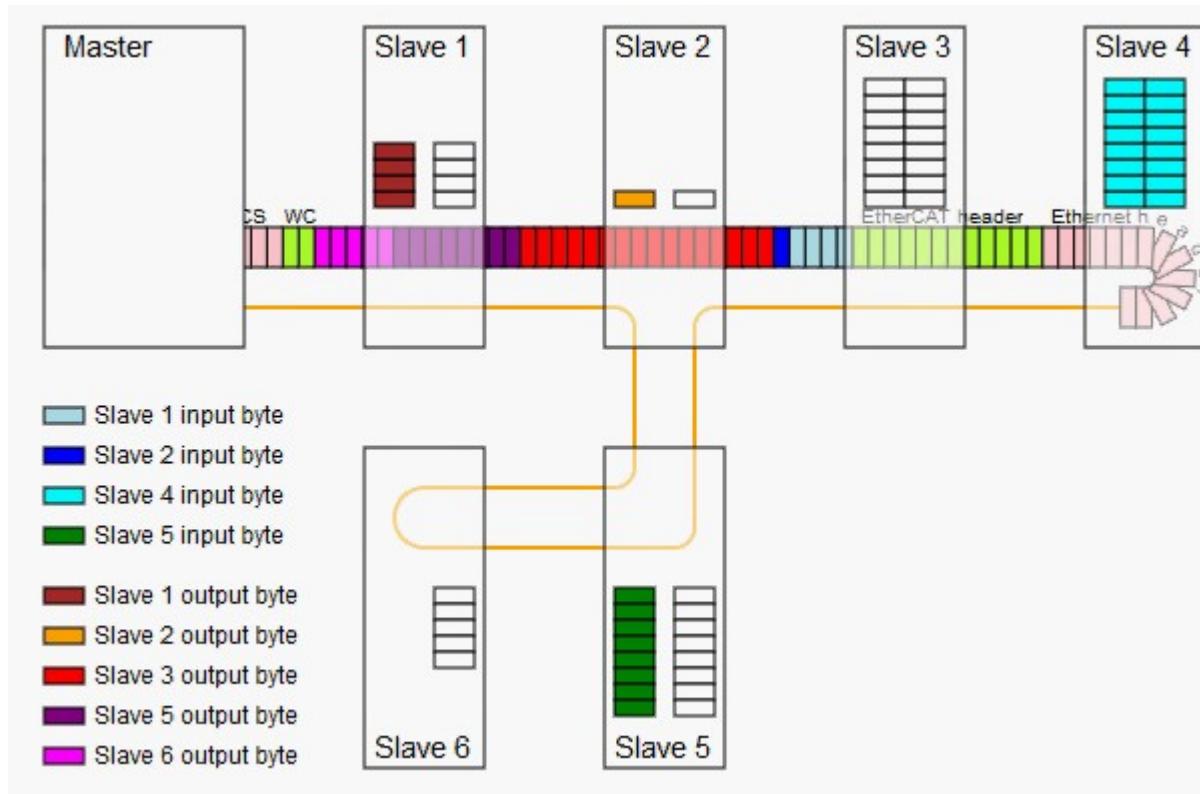

## EtherCAT timeout:

- If the EtherCAT communication exceeds a timeout all motors will stop. The user need to unset the EtherCAT timeout flag to continue.

**There is NO protection to prevent the manipulator to hit the joint limits.**

# EtherCAT

- Ethernet fieldbus
- Short cycle times can be achieved

# youBot API

- Open source C++ API for joint level control
- Provides full access to the firmware functionality
- API encapsulates EtherCAT communication
- Supported OS: Linux
- Framework independent (ROS and Orococos wrapper available)

# What can you do with the API?

Command and sense joint values:

- Position
- Velocity
- Current
- PWM

Configure all joint parameter

e.g. PID controller parameters

Move the base in cartesian space

# What can you NOT do with the API?

- Command 6 DOF cartesian position for the manipulator
- The API does not include a forward or inverse kinematic
- Command joint trajectories (wip)

# Properties of the youBot API?

- Object-oriented
- Reusable – not lock in to a framework like ROS or OROCOS
- Easy to use
- Communication details are hidden from the user
- Try to minimize implicit assumptions:
  - physical units are represented
  - value ranges are made explicit
  - there are no assumptions about the timing or the usage
  - platform assumptions are avoided

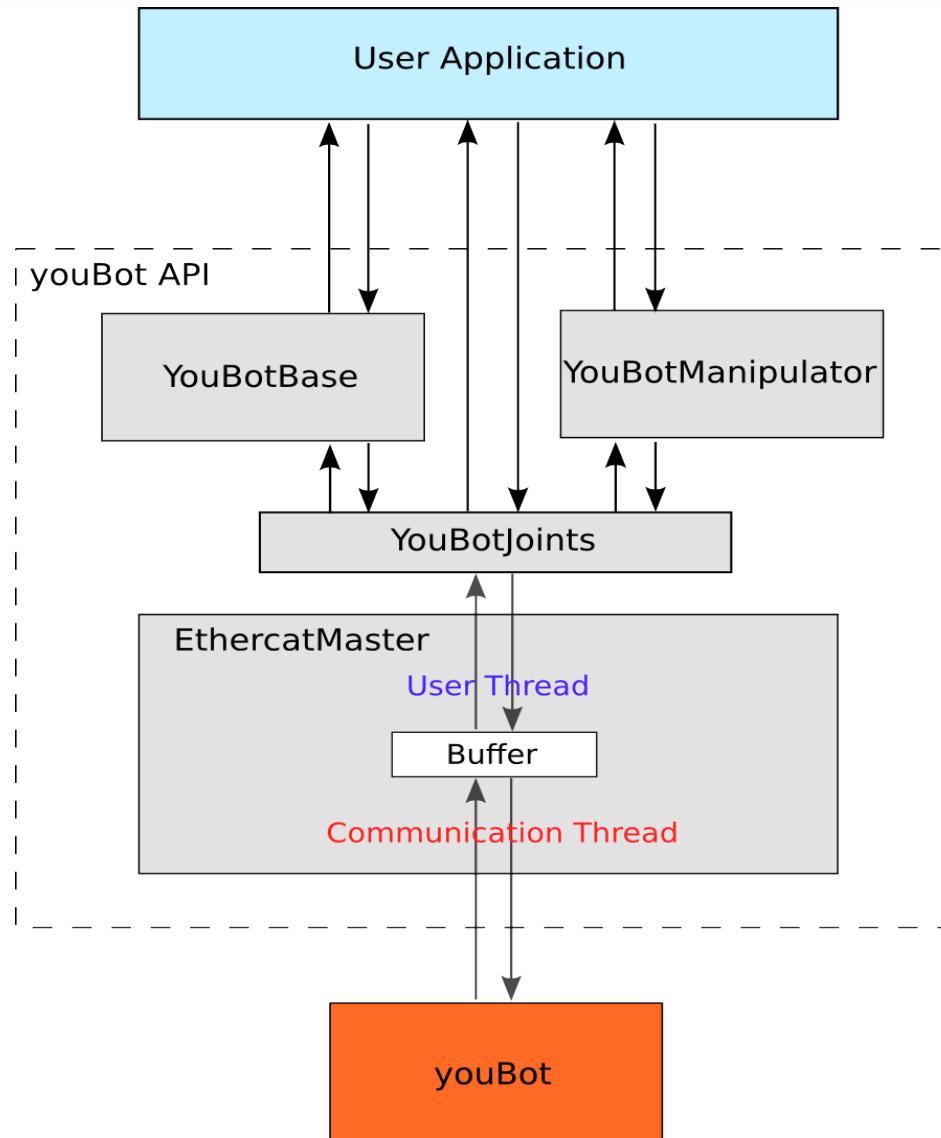

# Properties of the youBot API?

- interfaces are used to do abstraction
- stateful interfaces are minimized
- separation of constance
  - setData() used for data flow
  - setConfigurationParameter() used for configuration
- Each configuration parameter is one class
  - by inheritance it is easy to set multiple parameters at once

# youBot Driver overview

# Timing

## API with communication thread

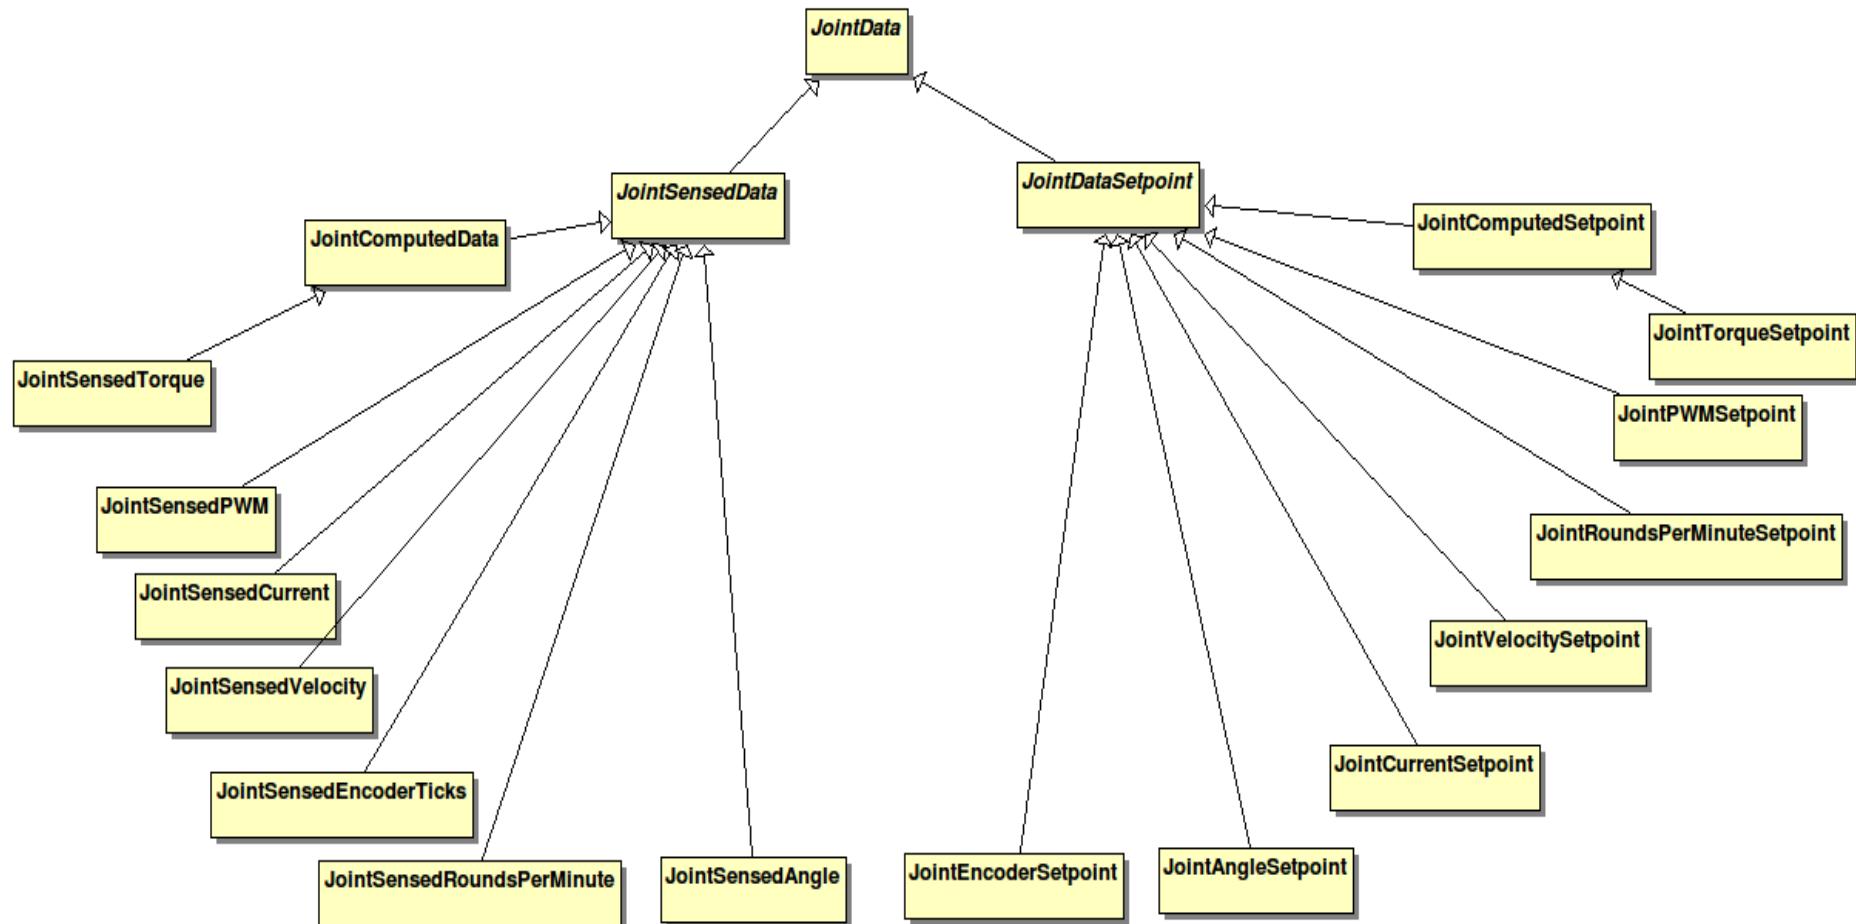

- default cycle time is 1 ms
- jitter is about 25 microseconds

## Without a communication thread

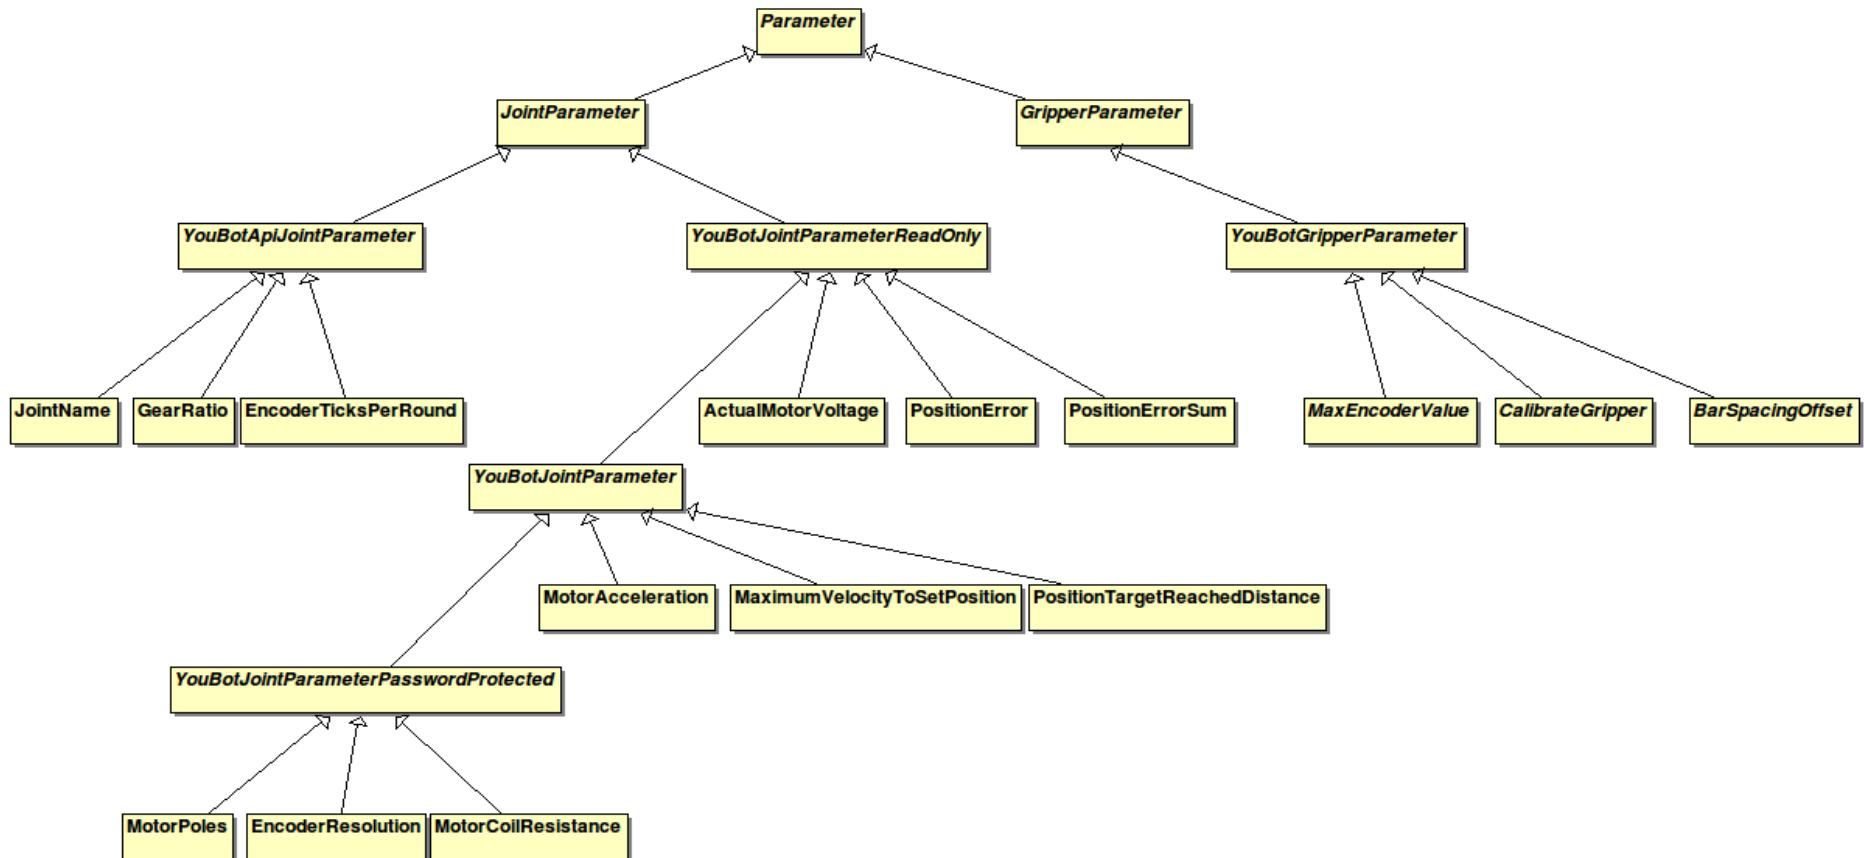

- the user has to call sendProcessData() and receiveProcessData() to trigger the communication
- This could be scheduled by a real time operating system

# EtherCAT Master Class Hierarchy

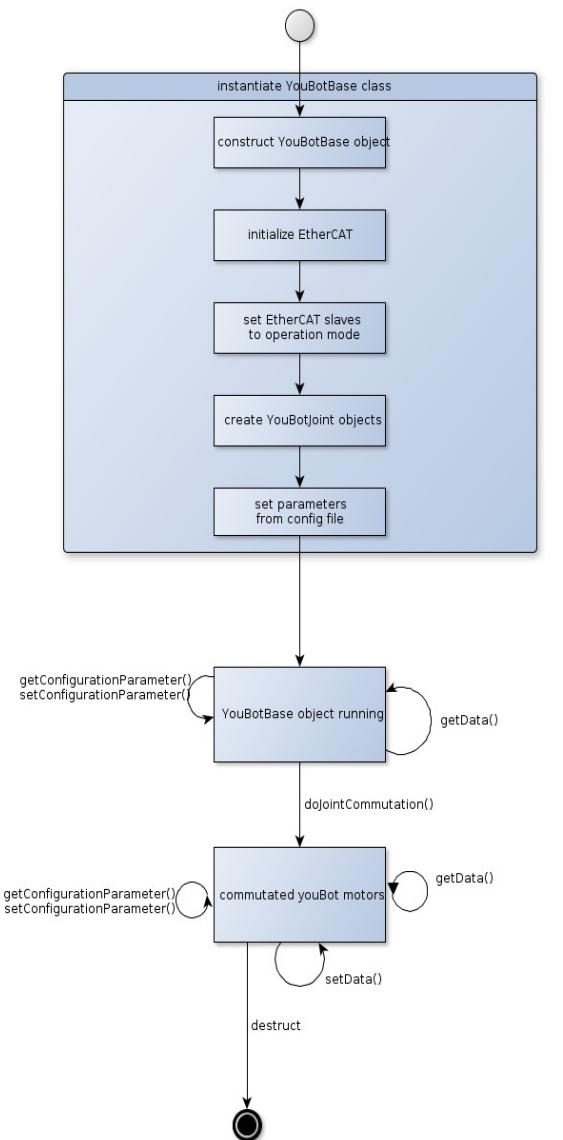

# YouBotGripper Class Hierarchy

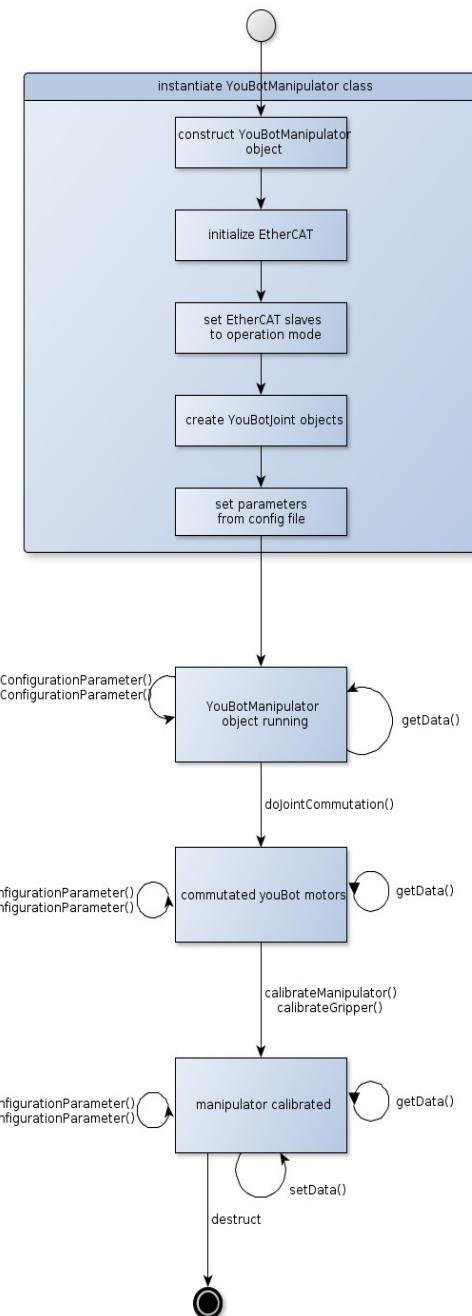

# Base Kinematic Class Hierarchy

API state machine for the youBot base

API state machine for the youBot manipulator

# API Configuration

The API configuration files are located in the config folder.

youbot-ethercat.cfg contains parameters for the EtherCAT communication:

- Ethernet device name
- cycle time of the communication thread
- ...

The topology of the youBot joint are in youbot-base.cfg, youbot-manipulator.cfg. You can assign to each YouBotJoint one EtherCAT slave.

Additionally the config files contain joint specific parameters like the gear ratio or the encoder ticks per round. These parameters are needed by the API to do proper calculations.

# Base example

```
#include "youbot/YouBotBase.hpp"

using namespace youbot;

int main() {
    try {
        // creates a YouBotBase instance with the name "youbot-base"
// which is also the name of the config file
        YouBotBase myYouBotBase("youbot-base");

        // do the sine commutation of the base joints
        myYouBotBase.doJointCommutation();
    }
}
```

# Base example

// create variables to set and get the base cartesian velocity and pose

```
quantity<si::velocity> longitudinalVelocity = 0.2 * meter_per_second;  
quantity<si::velocity> transversalVelocity = 0.0 * meter_per_second;  
quantity<si::angular_velocity> angularVelocity = 0 * radian_per_second;  
quantity<si::velocity> actualLongitudinalVelocity = 0 * meter_per_second;  
quantity<si::velocity> actualTransversalVelocity = 0 * meter_per_second;  
quantity<si::angular_velocity> actualAngularVelocity = 0 * radian_per_second;  
quantity<si::length> actualLongitudinalPose = 0 * meter;  
quantity<si::length> actualTransversalPose = 0 * meter;  
quantity<si::plane_angle> actualAngle = 0 * radian;
```

// sets the base cartesian velocity

```
myYouBotBase.setBaseVelocity(longitudinalVelocity, transversalVelocity, angularVelocity);
```

// reads the base cartesian velocity

```
myYouBotBase.getBaseVelocity(actualLongitudinalVelocity, actualTransversalVelocity, actualAngularVelocity);
```

// reads the base cartesian position which have been calculated from the odometry

```
myYouBotBase.getBasePosition(actualLongitudinalPose, actualTransversalPose, actualAngle);
```

// print the actual cartesian velocity

```
LOG(info) << "actual velocity longitudinal: " << actualLongitudinalVelocity <<  
" transversal: " << actualTransversalVelocity << " angular: " << actualAngularVelocity;
```

# Base example

```
//command base joint 1 a velocity of 2 radian per second
JointVelocitySetpoint setVel;
setVel.angularVelocity = 2 * radian_per_second;
myYouBotBase.getBaseJoint(1).setData(setVel);

} catch (std::exception& e) {
    std::cout << e.what() << std::endl;
} catch (...) {
    std::cout << "unhandled exception" << std::endl;
}
return 0;
}
```

# Manipulator example

```
#include "youbot/YouBotManipulator.hpp"
using namespace youbot;
int main() {
    try {
        // creates a YouBotManipulator instance with the name "youbot-manipulator" which is also the name of the config file
        YouBotManipulator myYouBotManipulator("youbot-manipulator");
        // do the sine commutation of the arm joints
        myYouBotManipulator.doJointCommutation();
        // calibrate the reference position of the arm joints
        myYouBotManipulator.calibrateManipulator();

        //receive motor current form joint 1 of the manipulator
        JointSensedCurrent current;
        myYouBotManipulator.getArmJoint(1).getData(current);
        std::cout << "Current manipulator joint 1: " << current.current << std::endl;

        //read the maximum positioning velocity parameter from the manipulator joint 1
        MaximumPositioningVelocity maxPositioningVelocity;
        myYouBotManipulator.getArmJoint(1).getConfigurationParameter(maxPositioningVelocity);
        quantity<angular_velocity> velocity;
        maxPositioningVelocity.getParameter(velocity);
        std::cout << "Maximum positioning speed of joint 1: " << velocity << std::endl;

        //configure 2 radian_per_second as the maximum positioning velocity of the manipulator joint 1
        maxPositioningVelocity.setParameter(2 * radian_per_second);
        myYouBotManipulator.getArmJoint(1).setConfigurationParameter(maxPositioningVelocity);

    } catch (std::exception& e) { std::cout << e.what() << std::endl; }
    return 0;
}
```

# Gripper example

```
#include "youbot/YouBotManipulator.hpp"
using namespace youbot;
int main() {
    Try {
        YouBotManipulator myYouBotManipulator("youbot-manipulator")
        // calibrate the reference position of the gripper
        myYouBotManipulator.calibrateGripper();

        // open the gripper 2 cm
        GripperBarSpacingSetPoint gripperSetPoint;
        gripperSetPoint.barSpacing = 0.02 * meter;
        myYouBotManipulator.getArmGripper().setData(gripperSetPoint);

    } catch (std::exception& e) {
        std::cout << e.what() << std::endl;
    } catch (...) {
        std::cout << "unhandled exception" << std::endl;
    }
    return 0;
}
```

# Data trace

```

myTrace.plotTrace();
```

# Installation

1. Install a minimal installation of ROS. (see [ros.org](http://ros.org))

2. Clone the youBot API sources:

```
git clone git://github.com/youbot/youbot_driver.git
```

3. Clone additional ros packages which include the SOEM (Simple Open EtherCAT master):

```
git clone git://github.com/janpaulus/brics-external-packages-ros.git
```

4. Add both repository folders to the ROS\_PACKAGE\_PATH environment variable.

5. Compile the youBot driver by typing:

```
rosmake youbot_driver --rosdep-install
```

# Additional information

- youBot software available on  
[https://github.com/youbot/youbot\\_driver](https://github.com/youbot/youbot_driver)
- Further information <http://youbot-store.com>
